Light

Dark

Three directions for Fairmeter

Each one is rendered with the reference bill's real figures — 161 units, ₹1,860.00 payable, split 60/40

between two metered households carrying a shared pump and 19 unaccounted units. Every column below adds back to the bill exactly, so you are judging the design against the numbers it will actually have to carry.

Canonical shows each direction in the mode it was designed for. Light and Dark force both, to check that neither falls apart. Pick one and I'll write it up as `BRAND.md` and rebuild the app's CSS on it.

INSTRUMENT PANEL — THE ENERGY METER ITSELF — GRAPHITE ENCLOSURE, LCD READOUT, THE RED PULSE LED.

The engine's claim is exactness: integer paise, largest-remainder allocation, shares that sum back to the bill with nothing dropped. This direction dresses the app as the measuring instrument that claim deserves — a sunk LCD window for every figure, hairline rules, nothing decorative. *Trade-off*: Dark-first means the print statement needs its own light treatment. Figures are monospace everywhere, which is right for money and slightly cold for prose.

FAIRMETER

One bill, split to the paisa.

The signature is the **ratio rail**: one horizontal bar, segmented by household, sitting directly under the header. It is the single consumption ratio that D-01 divides every charge by — so the one bar literally explains the whole document, and it repeats as a 3 px sliver at the head of each charge row.

COLUMNAR LEDGER — THE ACCOUNTANT'S GREEN COLUMNAR PAD — AND THE HANDWRITTEN REGISTER THIS APP REPLACES.

The product is a reckoning between neighbours, and it has to survive being printed and handed over. This direction makes the screen and the paper the same document: ruled columns, dense ink, one red pen for anything that needs a human decision. Trade-off:

Warm paper plus a serif display is close to a well-worn look; the green columnar rule and the cool ink are what keep it from being generic. Serif numerals are avoided — figures stay monospace.

Fairmeter

One bill, split to the paisa.

The signature is **real ruled columns** behind the breakdown table — the alternating band and the vertical rule are the pad, not a zebra-stripe effect. The residual, the one number nobody measured, is marked in red the way you would circle it by hand.

WIRING CODE — INDIAN HOUSE WIRING COLOURS — LIVE BROWN, NEUTRAL BLUE, EARTH GREEN.

The hardest thing to follow in this app is one household across four surfaces: the form, the table, the WhatsApp message and the print-out. This direction gives each household a wire colour and never lets it change, so you can trace a household by colour alone. **Trade-off:** The palette is bold and only works if household colours are assigned once and never reused. It also caps out around five or six households before the colours stop being distinguishable.

Fairmeter

One bill, split to the paisa.

The signature is the **three-core cross-section** — the split drawn as the cable that actually feeds the building. Colour does real work here: it is an identity channel, not decoration, so it is always paired with the household name (colour is never the only cue).

Nothing here is wired to the engine — the figures are a fixed sample in `src/ui/design/sample.ts`. Once you pick a direction this page can stay as a living style reference or be deleted; it costs nothing in the production bundle either way, since it is only reachable from the dev button.
